1. Overview

1.1 HIPS MHR Overview

In 2012, the Australian Government launched the implementation of the My Health Record (MHR) formerly known as Personally Controlled Electronic Health Record.

The purpose of MHR is to provide information securely in one place nationally using an electronic portal. The portal allows consumers and clinicals to upload health related documents to a centralised repository to improve sharing patient information amongst health care providers for the benefit of optimising the patient care continuum. The ability to share consumer health information nationally has the potential to positively impact health outcomes.

1.2 Background

Prior to the Exception/Self Reporting Tool build there were limitations to view issues or errors with health orientated document uploads. A strategy to improve this came from hospitals requesting this information so they could remediate their own data and improve the overall quality and integrity of the uploads to MYHR.

Health Organisations including, hospitals, community, and aged care facilities within Victoria have been or will be in the future connected to HIPS to upload documents to the MHR system.

Health Organisations are uploading discharge summaries and where possible they will also upload pathology and diagnostic results. These documents will extend to include other document types such as Pharmacist Medicines List Summary (PSML), shared health summary, event summaries and more. Improving data quality and providing statistical information regarding the uploaded documents has been a priority for Health Technology Solutions since MHR was introduced to the Victorian Public Health Sector (VPHS) Victoria.

1.3 Purpose

The purpose of this document is to provide a guide on how to use the Exception/Self Reporting tool.

The key purpose of the tool is to provide statistical information, provide exception details and to provide person level audit tracking while giving health organisations the ability to improve data quality and improve data integrity.

The Exception/Self Reporting Tool provides different information to the National HIPS View (UI). The tools are completely independent of each other. The Exception/Self Reporting tool is managed by HTS Integration Architecture and Development team. The MHR View (UI) has been derived by the Australian Digital Health Agency (ADHA). The HIPS View (UI) forms part of the overall HIPS/MHR offering that allows consumers to view clinical uploaded health documents such as discharge summaries, pathology results, imaging results, immunisation records, medicine lists, GP notes and more.

The Exception/Self Reporting Tool provides the following functionality to the users at health organisations including, Hospitals, Community, Aged Care:

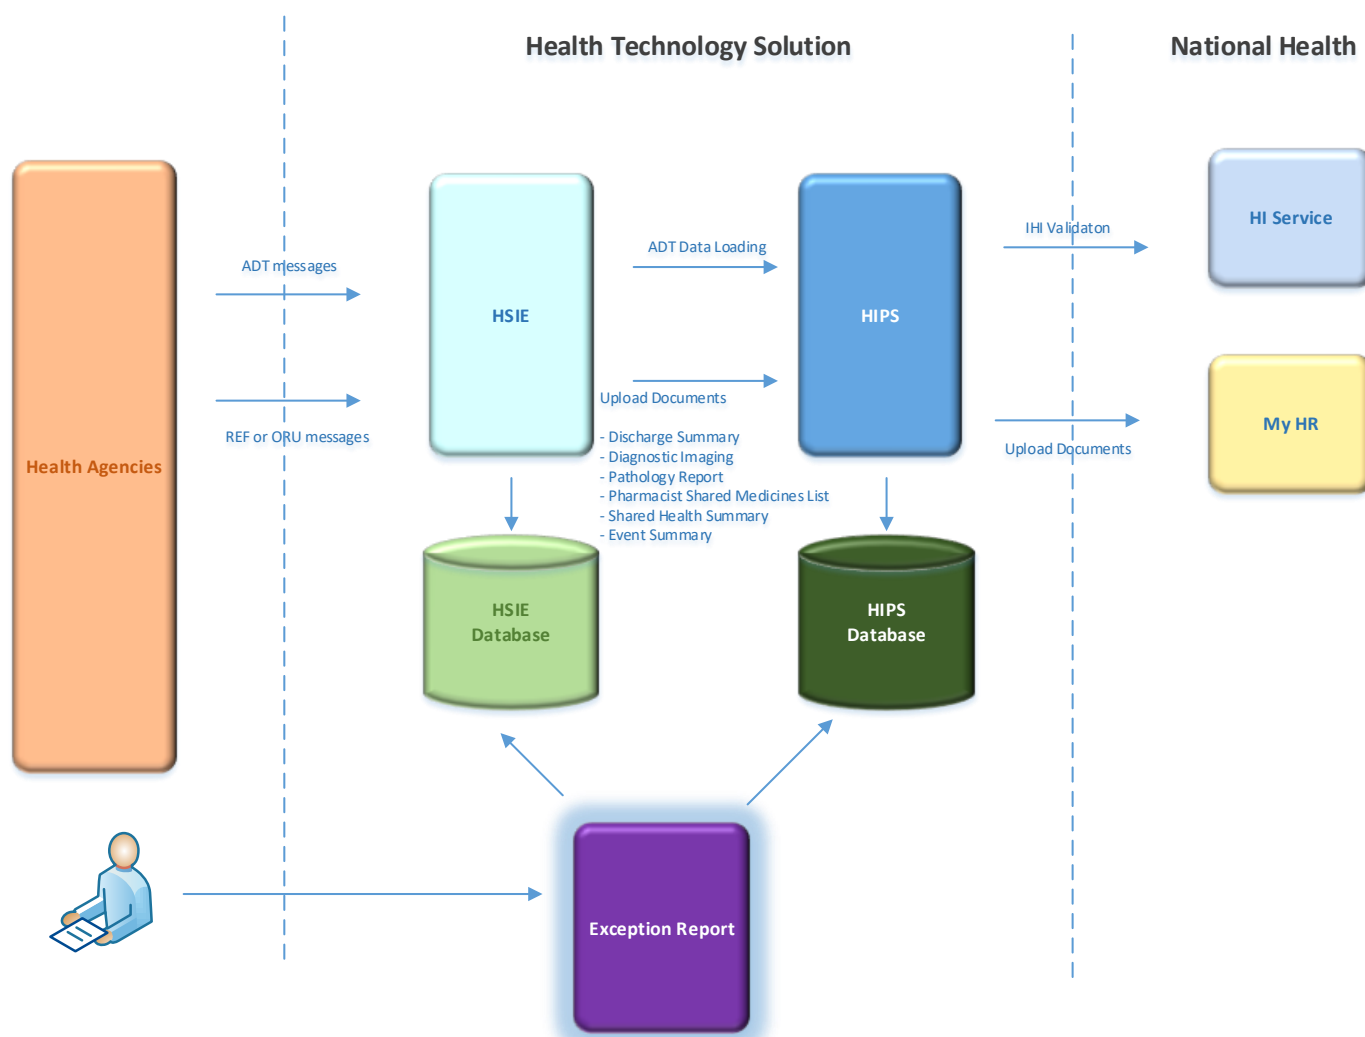

- Upload Information
- Summary Report
- Exception Detail
- System Audit
- User Settings
- Online Documentation

2. How the application works

2.1 Flow Process Diagram

The following diagram demonstrates the message process flow from health agencies to national Health Organisations including, Hospitals, Community, Aged Cares through HTS.

It highlights where the HIPS Exception/Self Reporting Application sits in the overall architecture.

2.2 User Access Environment

The HIPS Exception/Self Reporting tool is designed as a web application hosted by Health Technology Solutions (HTS). It means users are able to access the tool via web browsers without any installation or configuration at their ends.

Users can simply launch any web browsers such as Chrome, MS Edge, Firefox or Safari and access the following URL within HealthNet.

- Non-Production: <https://hipsreport.prod.services>
- Production: <https://hipsreport.prod.services>

Please note that IE (Internet Explorer) may not be compatible and highly recommended using other browsers.

3. Main Features

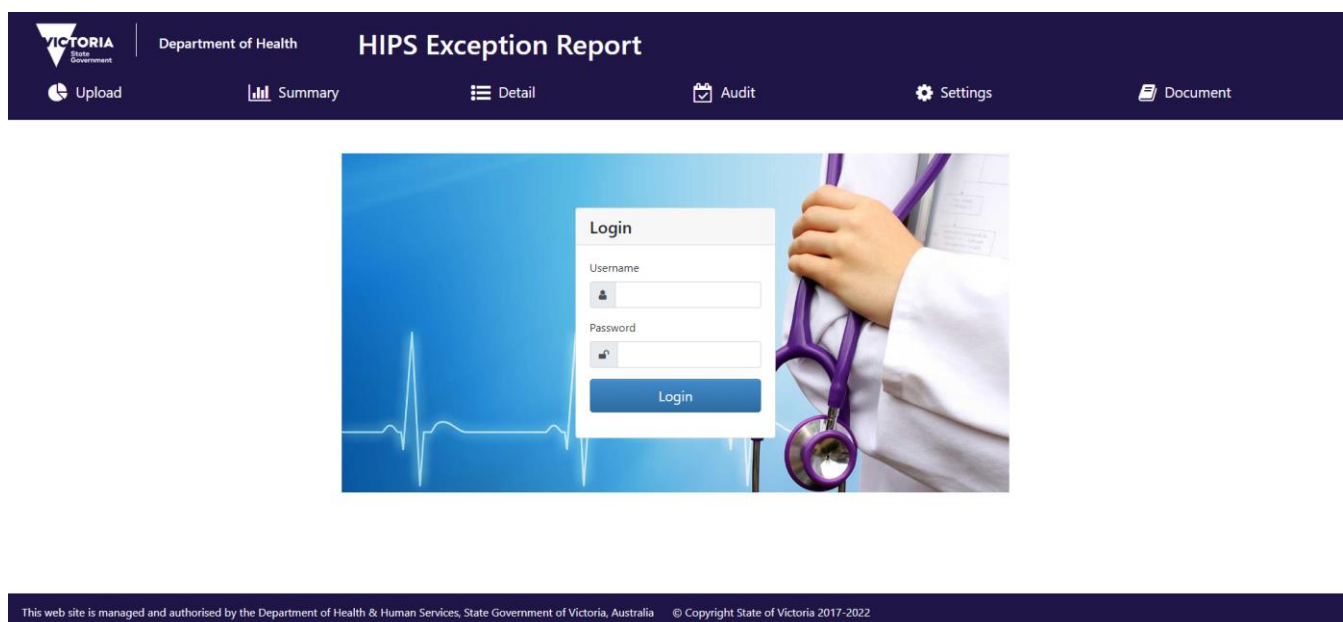

3.1 Log into the HIPS Exception/Self Reporting Tool

Once users reach to the link by web browser, the below screen comes up at first.

Users are ready to log in using username – normally the same as SWAD ID if exists - and password.

Please note that this is not a single sign on application with other application so password is different from SWAD account even username can be same.

If users are not sure the password, please contact to HTS by raising a service request. HTS will reset the password for you to be granted access. Once login successfully done, you can update your password via the menu 'User Settings'.

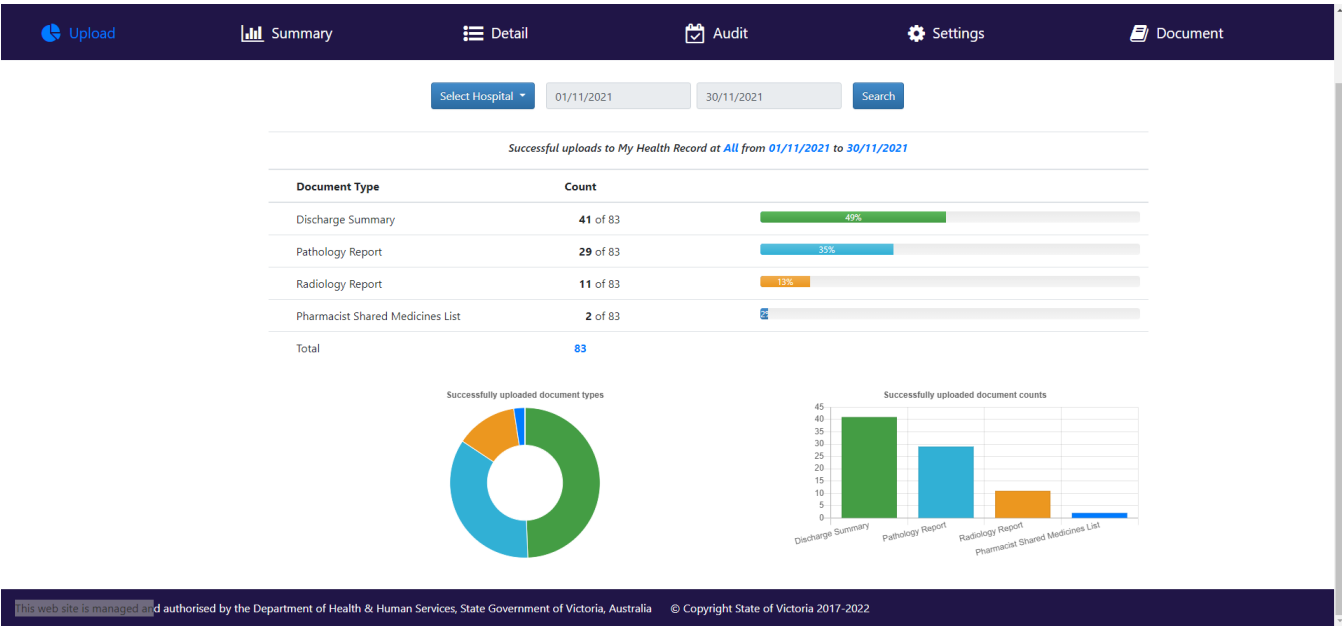

The screenshot displays the login interface for the 'HIPS Exception Report' tool. At the top, a dark blue header bar contains the 'VICTORIA State Government' logo, the text 'Department of Health', and the title 'HIPS Exception Report'. Below the title, a navigation menu includes icons and labels for 'Upload', 'Summary', 'Detail', 'Audit', 'Settings', and 'Document'. The main content area features a login form with a 'Login' title, 'Username' and 'Password' input fields (each with a small icon), and a 'Login' button. The background of the login form is a blue gradient with a white ECG line. To the right of the form, a hand in a white lab coat holds a purple stethoscope. At the bottom of the page, a dark blue footer bar contains the text: 'This web site is managed and authorised by the Department of Health & Human Services, State Government of Victoria, Australia © Copyright State of Victoria 2017-2022'.

Once you login, by default users land on Upload Info menu unless users choose any other menus.

3.2 Upload Info

Users can select a hospital and a date range. It is recommended to keep the timeframes to weekly or daily, to ensure performance is not impacted. To avoid the impact on the other applications and databases, within 6 weeks date range is currently allowed.

This screen will display graphical representation of the total of Discharge Summaries, Pathology Reports, Diagnostic Imaging, Pharmacist Shared Medicines List, Shared Health Summary and Event Summary. It will list the portion of successfully uploaded message counts per document types with the high-level glance.

As you can see the above, search result shows you a general figure of how many documents were transferred successfully to MHR.

3.3 Summary Report

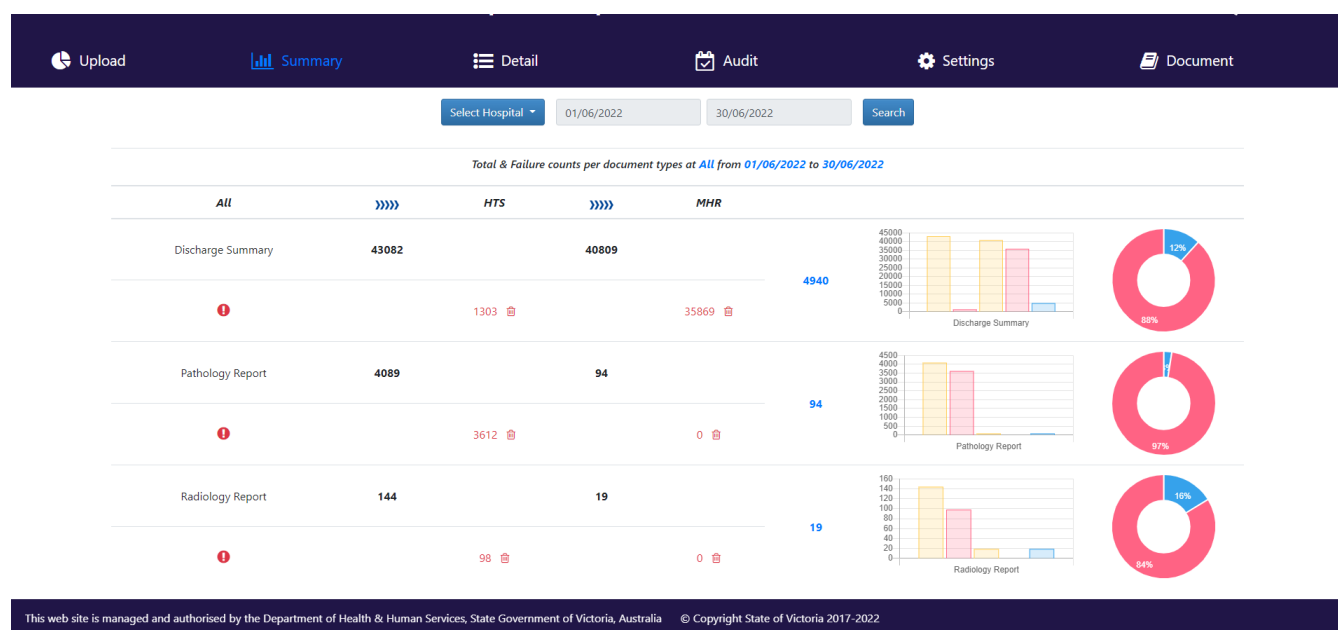

The Summary Report screen will provide further detailed delivery statuses of messages health organisations have sent to MHR via HTS. Users can click the Search button after the same way for their selection criteria as the Upload Info menu.

The Summary Report screen provides a break down total, failed figures into several stages with the final success counts per document type. The First line on the document type indicates the total number of documents while the second line with red colour shows the failed number. If you hover over the red number, it pops up the tooltip showing a general idea of the common error cases happened before. (Please be aware that it doesn't reflect the actual reason for user's errors)

For clearer display of errors that are fixable by health organisations, as opposed to connectivity issues, duplicate handling etc which will now be displayed with a new icon (like a rubbish bin) to separate health organisation fixable to non-fixable errors.

The last number on the merged column with blue colour represents the final successful uploaded documents count.

The page also illuminates the numeric figures into the graphical information for a better understanding at a glance. The Bar chart shows the count change with chronological order while the donut chart simply provides success/failed rates.

3.4 Exception Detail

The Exception Detail menu reaches into the HSIE & HIPS database to provide a detailed view of the message failures.

Unlike Upload Info or Summary Page menus, there is an additional user selection, document type checkbox.

The metadata is provided for the patients' records being uploaded to My Health Record, and the screen visualises the information with the tabular structure. It consists of multiple sortable columns representing transaction date time stamp, document type, exception details showing the problem, admission date, episode, patient information such as patient name, mrn, dob and gender.

The last column is the enveloped icon named Msg provides you with the ability of retrieving the original HL7 message for your investigation.

There are some additional features on this page where the user can type the string keyword where the filter option resides, or user can filter on the information resulted by the initial search.

Detailed report page is also ready to export the report data in Text, CSV, Excel and PDF format.

3.5 Audit Info

The audit Info menu is designed to highlight clinicians or staff at each health agencies that have accessed patient information. This is particularly useful for auditing professional use versus snooping into a person's record which is unauthorised.

The way to search the audit info is similar to other menus but the Patient Information text field; otherwise, the system brings up a bunch of audit records without the specific patient information.

Patient Information can be filled with any patient relevant information such as first name, family name, mrn or IHI.

Users retrieve the audit information with tabular data including timestamp, patient name, mrn, IHI, service name showing which action performed, document name if available in case of 'Retrieve Document' at service name column, accessed by and clinician id.

The last column is the person icon named Patient provides you with the ability of retrieving the patient demographic data with patient relevant Ids.

Like the Exception Detail menu, the audit info page is also ready to export the report data in Text, CSV, Excel and PDF format.

3.6 User Settings

User setting is designed for users to edit their own profile and reset the password by themselves.

If a new user needs to be registered, health agencies can raise a service request to HTS Service Desk first then Integration team will examine the suitability of users and create a new user with the default password if required.

Once a new user is provided with username and default password, he or she can login with username and default password then encouraged to change password by themselves using this menu.

The picture below shows the user setting menu.

The screenshot shows the 'HIPS Exception Report' interface. At the top, there is a navigation bar with the Victoria State Government logo, 'Department of Health', and the title 'HIPS Exception Report'. On the right, it says 'abc123 on behalf of [Viewer]' and has a share icon. Below the navigation bar is a menu with 'Upload', 'Summary', 'Detail', 'Audit', 'Settings' (highlighted), and 'Document'. The main content area is titled 'User abc123 Information' and contains a table with user details. At the bottom of the table are 'Edit' and 'Change Password' buttons. A footer at the very bottom states: 'This web site is managed and authorised by the Department of Health & Human Services, State Government of Victoria, Australia © Copyright State of Victoria 2017-2022.'

3.7 Online Documentation

User guide is attached under the document menu to share the latest version of documentations and centralise the resource at one spot.

Sometimes the change on the application can't be avoidable due to the uncontrollable situations, for example the database schema change by HIPS upgrade.

HTS is going to manage the change and publish updates under the document menu which enables users to access an up-to-date version of the document all the time without asking it manually.

Because a document is provided as a PDF, users can simply download it into the local drive or print it by a connected printer on the spot.

4. Appendix

4.1 Release Note

The below shows the list of new enhancements since the last version.

- New position of the toolbar at the top of the screen to allow more page real estate in the body of the results pages
- Addition of the document type column to view document type uploading to MYHR. Ex> Discharge Summary, Pathology, Imaging results, PSML, Shared Health Summary and Event Summary
- Clearer display of errors that are fixable by health organisations, as opposed to connectivity issues, duplicate handling etc which will now be displayed with a new icon (like a rubbish bin) to separate health organisation fixable to non-fixable errors.
- Alphabetical ordered health organisation selections
- Date ranges that are retained as you navigate to another page, so that you are not re-entering the same date range into every screen
- Improved look and feel of the dashboard
- Integrated documentation to review release notes and provide training notes/user guide
- Check box for document type in detail page for exception search
- Extended date ranges to 6 weeks - good to have a monthly report
- Current menu is highlighted to show which menu users perform
- Updated database search to align with the latest HIPS upgrade
- Document name added in audit page if service name is 'Retrieve Document'
- New access profile for ADHA team
- Displaying a custom error page for 403, 404 & 500 error

4.2 Contact

Users are encouraged to raise a service request via HTS Service Desk if they would like further investigation on the data or no relevant information found via the HIPS Exception/Self Reporting Tool.

Other enquiries can reach the application owner Di (dianne.linnell@htsv.org.au) or Jin (jinyhung.seo@htsv.org.au) via email.

4.3 Glossary

Here is the list of acronyms for the terminologies.

Abbreviation	Description
ADHA	Australian Digital Health Agency
DHS	The Department of Health Services
HIPS	Healthcare Information Provider Service
HSIE	Health Service Integration Engine
HTS	Health Technology Solutions
MHR	My Health Record
MHR HIPS UI	My Health Record HIPS User Interface
NIO	National Infrastructure Operator
PCEHR	Personally Controlled Electronic Health Record
SWAD	State Wide Active Directory
VPHS	Victorian Public Health Organisations including, Hospitals, Community, Aged Cares
